# Chapter 1

## TireGround

A repository for the code developed by Davide Stocco for his thesis.

Department of Industrial Engineering  
Master Degree in Mechatronics Engineering

**EN: Real-Time Computation of Tire/Road Contact using Tailored Algorithms**

**IT: Valutazione Real-Time del Contatto Pneumatico/Strada con Algoritmi Dedicati**

Academic Year 2019 · 2020

Author: **Davide Stocco**

Supervisor & Co-supervisor: **Prof. Enrico Bertolazzi & Dr.Eng. Matteo Ragni**

### MagicFormula tire model usage

1. Load .rdf file.

```
TireGround::RDF::MeshSurface Road(  
    "./file.rdf" // Path to the *.rdf file  
);
```

2. Initialize the MagicFormula tire model.

```
TireGround::Tire* TireSD = new TireGround::MagicFormula(  
    SectionWidth, // [mm]  
    AspectRatio,  // [%]  
    RimDiameter,  // [in]  
    SwitchNumber  // Maximum RoadTriangles in the Tire Shadow (switch to sampling)  
);
```

3. Contact evaluation.

```
bool Out = TireSD->setup( Road, // Road mesh  
                          TransfMat // 4x4 total transformation matrix  
);
```

4. Data extraction.

```
// Variable initialization (for real numbers)  
TireGround::vec3 N;  
TireGround::vec3 P;  
TireGround::real_type Friction;  
TireGround::real_type Rho;  
TireGround::real_type RhoDot;  
TireGround::real_type RelativeCamber;  
TireGround::real_type Area;  
TireGround::real_type Volume;  
  
// Data extraction (for real numbers)  
TireSD->getNormal(N);
```

```

TireSD->getMFpoint(P);
TireSD->getFriction(Friction);
TireSD->getRho(Rho);
TireSD->getRhoDot(PreviousRho,TimeStep,RhoDot);
TireSD->getRelativeCamber(RelativeCamber);
TireSD->getArea(Area);
TireSD->getVolume(Volume);

// Extract data stucture size
TireGround::int_type size = TireSD->getDisksNumber();

// Variable initialization (for vectors)
TireGround::row_vec3 NVec(size);
TireGround::row_vec3 PVec(size);
TireGround::row_vecN FrictionVec(size);
TireGround::row_vecN RhoVec(size);
TireGround::row_vecN RhoDotVec(size);
TireGround::row_vecN RelativeCamberVec(size);
TireGround::row_vecN AreaVec(size);
TireGround::row_vecN VolumeVec(size);

// Data extraction (for vectors)
TireSD->getNormal(NVec);
TireSD->getMFpoint(PVec);
TireSD->getFriction(FrictionVec);
TireSD->getRho(RhoVec);
TireSD->getRhoDot(PreviousRho,TimeStep,RhoDotVec);
TireSD->getRelativeCamber(RelativeCamberVec);
TireSD->getArea(AreaVec);
TireSD->getVolume(VolumeVec);

```

## MultiDisk tire model usage

### 1. Load .rdf file.

```

TireGround::RDF::MeshSurface Road(
    "./file.rdf" // Path to the *.rdf file
);

```

### 2. Initialize the MultiDisk tire model:

#### (a) MultiDisk tire without sidewall radius (uniform cylinder).

```

TireGround::Tire* TireMD = new TireGround::MultiDisk(
    SectionWidth, // [mm]
    AspectRatio, // [%]
    RimDiameter, // [in]
    PointsNumber, // Sampling points for each disk
    DisksNumber, // Disks number
    SwitchNumber // Maximum RoadTriangles in the Tire Shadow (switch to sampling)
);

```

#### (b) MultiDisk tire with sidewall radius (uniform cylinder with filleted sidewall edge).

```

TireGround::Tire* TireMD = new TireGround::MultiDisk(
    SectionWidth, // [mm]
    AspectRatio, // [%]
    RimDiameter, // [in]
    SideRadius, // Sidewall radius [mm]
    PointsNumber, // Sampling points for each disk
    DisksNumber, // Disks number
    SwitchNumber // Maximum RoadTriangles in the Tire Shadow (switch to sampling)
);

```

#### (c) MultiDisk tire with custom disks radius.

```

TireGround::Tire* TireMD = new TireGround::MultiDisk(
    SectionWidth, // [mm]
    AspectRatio, // [%]
    RimDiameter, // [in]
    RadiusVec, // Disks radius vector [m]
    PointsNumber, // Sampling points for each disk
    SwitchNumber // Maximum RoadTriangles in the Tire Shadow (switch to sampling)
);

```

### 3. Contact evaluation.

---

```
bool Out = TireMD->setup( Road,      // Road mesh
                        TransfMat // 4x4 total transformation matrix
                        );
```

#### 4. Data extraction for contact point(s).

```
// Variable initialization (for real numbers)
TireGround::vec3 N;
TireGround::vec3 P;
TireGround::real_type Friction;
TireGround::real_type Rho;
TireGround::real_type RhoDot;
TireGround::real_type RelativeCamber;
TireGround::real_type Area;
TireGround::real_type Volume;

// Data extraction (for real numbers)
TireMD->getNormal(N);
TireMD->getMFpoint(P);
TireMD->getFriction(Friction);
TireMD->getRho(Rho);
TireMD->getRhoDot(PreviousRho, TimeStep, RhoDot);
TireMD->getRelativeCamber(RelativeCamber);
TireMD->getArea(Area);
TireMD->getVolume(Volume);

// Extract data stucture size
TireGround::int_type size = TireSD->getDisksNumber();

// Variable initialization (for vectors)
TireGround::row_vec3 NVec(size);
TireGround::row_vec3 PVec(size);
TireGround::row_vecN FrictionVec(size);
TireGround::row_vecN RhoVec(size);
TireGround::row_vecN RhoDotVec(size);
TireGround::row_vecN RelativeCamberVec(size);
TireGround::row_vecN AreaVec(size);
TireGround::row_vecN VolumeVec(size);

// Data extraction (for vectors)
TireMD->getNormal(NVec);
TireMD->getMFpoint(PVec);
TireMD->getFriction(FrictionVec);
TireMD->getRho(RhoVec);
TireMD->getRhoDot(PreviousRho, TimeStep, RhoDotVec);
TireMD->getRelativeCamber(RelativeCamberVec);
TireMD->getArea(AreaVec);
TireMD->getVolume(VolumeVec);
```

# Chapter 2

## Namespace Index

### 2.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

<a href="#">TireGround</a>	
<a href="#">Tire</a> computations routines . . . . .	11
<a href="#">TireGround::algorithms</a>	
Algorithms for <a href="#">tire</a> computations routine . . . . .	13
<a href="#">TireGround::RDF</a>	
<a href="#">RDF</a> mesh computations routines . . . . .	15
<a href="#">TireGround::RDF::algorithms</a>	
Algorithms for <a href="#">RDF</a> mesh computations routine . . . . .	16

## Chapter 3

# Hierarchical Index

### 3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

TireGround::RDF::BBox2D . . . . .	19
TireGround::Disk . . . . .	20
TireGround::ETRTO . . . . .	25
TireGround::RDF::MeshSurface . . . . .	37
TireGround::ReferenceFrame . . . . .	55
TireGround::SamplingGrid . . . . .	58
TireGround::Shadow . . . . .	61
TicToc . . . . .	62
TireGround::Tire . . . . .	62
TireGround::MagicFormula . . . . .	26
TireGround::MultiDisk . . . . .	40
TireGround::RDF::Triangle3D . . . . .	73
TireGround::RDF::TriangleRoad . . . . .	76

# Chapter 4

## Class Index

### 4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">TireGround::RDF::BBox2D</a>	
2D Bounding Box class . . . . .	19
<a href="#">TireGround::Disk</a>	
Tire disk . . . . .	20
<a href="#">TireGround::ETRTO</a>	
Tire ETRTO denomination . . . . .	25
<a href="#">TireGround::MagicFormula</a>	
Pacejka <a href="#">MagicFormula</a> contact model . . . . .	26
<a href="#">TireGround::RDF::MeshSurface</a>	
Mesh surface . . . . .	37
<a href="#">TireGround::MultiDisk</a>	
Multi-disk tire contact model . . . . .	40
<a href="#">TireGround::ReferenceFrame</a>	
Reference frame . . . . .	55
<a href="#">TireGround::SamplingGrid</a>	
Patch evaluation precision . . . . .	58
<a href="#">TireGround::Shadow</a>	
2D shadow (2D bounding box enhancement) . . . . .	61
<a href="#">TicToc</a> . . . . .	62
<a href="#">TireGround::Tire</a>	
Base class for <a href="#">Tire</a> models . . . . .	62
<a href="#">TireGround::RDF::Triangle3D</a>	
3D triangle (pure geometrical description) . . . . .	73
<a href="#">TireGround::RDF::TriangleRoad</a>	
3D triangles for road representation . . . . .	76

# Chapter 5

## Namespace Documentation

*Calculate minimum and maximum in XY plane for 2D vectors.*
- [real\\_type trapezoidArea](#) ([real\\_type](#) const Base2, [real\\_type](#) const Base1, [real\\_type](#) const Height)  
*Calculate area of a trapezoid [ m<sup>2</sup>].*

### 5.2.1 Detailed Description

Algorithms for tire computations routine.

### 5.2.2 Function Documentation

#### 5.2.2.1 intersectPointSegment()

```
bool TireGround::algorithms::intersectPointSegment (
    vec2 const & Point1,
    vec2 const & Point2,
    vec2 const & PointQ )
```

Check if a point lays inside or outside a line segment

Warning: The point query point must be on the same rect of the line segment!

Parameters

<i>Point1</i>	Line segment point 1
<i>Point2</i>	Line segment point 2
<i>PointQ</i>	Query point

### 5.2.2.2 intersectRayPlane()

```
bool TireGround::algorithms::intersectRayPlane (
    vec3 const & planeN,
    vec3 const & planeP,
    vec3 const & RayPoint,
    vec3 const & RayDirection,
    vec3 & IntersectionPt )
```

Check if a segment hits a plane and find the intersection point.

Parameters

<i>planeN</i>	Plane normal vector
<i>planeP</i>	Plane known point
<i>RayPoint</i>	Ray point
<i>RayDirection</i>	Ray direction
<i>IntersectionPt</i>	Intersection point

### 5.2.2.3 minmax\_XY() [1/2]

```
void TireGround::algorithms::minmax_XY (
    row_vec3 const & Points,
    vec2 & XYmin,
    vec2 & XYmax )
```

Calculate minumum and maximum in *XY* plane for 3D vectors.

Parameters

<i>Points</i>	3D points vector
<i>XYmin</i>	Minimum ( <i>X</i> , <i>Y</i> ) values
<i>XYmax</i>	Maximum ( <i>X</i> , <i>Y</i> ) values

### 5.2.2.4 minmax\_XY() [2/2]

```
void TireGround::algorithms::minmax_XY (
    row_vec2 const & Points,
    vec2 & XYmin,
    vec2 & XYmax )
```

Calculate minumum and maximum in *XY* plane for 2D vectors.

Parameters

<i>Points</i>	2D points vector
<i>XYmin</i>	Minimum ( <i>X</i> , <i>Y</i> ) values
<i>XYmax</i>	Maximum ( <i>X</i> , <i>Y</i> ) values

## 5.2.2.5 trapezoidArea()

```
real_type TireGround::algorithms::trapezoidArea (
    real_type const Base2,
    real_type const Base1,
    real_type const Height ) [inline]
```

Calculate area of a trapezoid [  $m^2$  ].

Parameters

<i>Base2</i>	Base 1
<i>Base1</i>	Base 2
<i>Height</i>	Height

## 5.2.2.6 weightedMean() [1/2]

```
real_type TireGround::algorithms::weightedMean (
    row_vecN const & Values,
    row_vecN const & Weights )
```

Calculate arithmetic weighted mean for real numbers.

Parameters

<i>Values</i>	Values (real numbers)
<i>Weights</i>	Weights (real numbers)

## 5.2.2.7 weightedMean() [2/2]

```
vec3 TireGround::algorithms::weightedMean (
    row_vec3 const & Values,
    row_vecN const & Weights )
```

Calculate arithmetic weighted mean for 3D vectors.

Parameters

<i>Values</i>	Values (3D vectors)
<i>Weights</i>	Weights (real numbers)

## 5.3 TireGround::RDF Namespace Reference

[RDF](#) mesh computations routines.

Namespaces

- [algorithms](#)

Algorithms for [RDF](#) mesh computations routine.

## Classes

- class [BBox2D](#)  
*2D Bounding Box class*
- class [MeshSurface](#)  
*Mesh surface.*
- class [Triangle3D](#)  
*3D triangle (pure geometrical description)*
- class [TriangleRoad](#)  
*3D triangles for road representation*

## Typedefs

- typedef std::shared\_ptr< [TriangleRoad](#) > [TriangleRoad\\_ptr](#)  
*Shared pointer to [TriangleRoad](#) object.*
- typedef std::vector< [TriangleRoad\\_ptr](#) > [TriangleRoad\\_list](#)  
*Vector of shared pointers to [TriangleRoad](#) objects.*

### 5.3.1 Detailed Description

[RDF](#) mesh computations routines.

## 5.4 TireGround::RDF::algorithms Namespace Reference

Algorithms for [RDF](#) mesh computations routine.

## Functions

- void [split](#) (std::string const &in, std::vector< std::string > &out, std::string const &token)  
*Split a string into a string array at a given token.*
- std::string [tail](#) (std::string const &in)  
*Get tail of string after first token and possibly following spaces.*
- std::string [firstToken](#) (std::string const &in)  
*Get first token of string.*
- template<typename T >  
T const & [getElement](#) (std::vector< T > const &elements, std::string const &index)  
*Get element at given index position.*

### 5.4.1 Detailed Description

Algorithms for [RDF](#) mesh computations routine.

### 5.4.2 Function Documentation

#### 5.4.2.1 firstToken()

```
std::string TireGround::RDF::algorithms::firstToken (
    std::string const & in )
```

Get first token of string.

## Parameters

<i>in</i>	Input string
-----------	--------------

## 5.4.2.2 getElement()

```
template<typename T >
T const& TireGround::RDF::algorithms::getElement (
    std::vector< T > const & elements,
    std::string const & index )
```

Get element at given index position.

## Parameters

<i>elements</i>	Elements vector
<i>index</i>	Index position

## 5.4.2.3 split()

```
void TireGround::RDF::algorithms::split (
    std::string const & in,
    std::vector< std::string > & out,
    std::string const & token )
```

Split a string into a string array at a given token.

## Parameters

<i>in</i>	Input string
<i>out</i>	Output string vector
<i>token</i>	Token

## 5.4.2.4 tail()

```
std::string TireGround::RDF::algorithms::tail (
    std::string const & in )
```

Get tail of string after first token and possibly following spaces.

## Parameters

<i>in</i>	Input string
-----------	--------------

# Chapter 6

## Class Documentation

### 6.1 TireGround::RDF::BBox2D Class Reference

2D Bounding Box class

```
#include <RoadRDF.hh>
```

#### Public Member Functions

- [BBox2D](#) ()  
*Default constructor.*
- [BBox2D](#) ([vec3](#) const Vertices[3])  
*Variable set constructor.*
- void [setXmin](#) ([real\\_type](#) const \_Xmin)  
*Set  $X_{min}$  shadow domain.*
- void [setYmin](#) ([real\\_type](#) const \_Ymin)  
*Set  $Y_{min}$  shadow domain.*
- void [setXmax](#) ([real\\_type](#) const \_Xmax)  
*Set  $X_{max}$  shadow domain.*
- void [setYmax](#) ([real\\_type](#) const \_Ymax)  
*Set  $Y_{max}$  shadow domain.*
- [real\\_type](#) [getXmin](#) (void) const  
*Get  $X_{min}$  shadow domain.*
- [real\\_type](#) [getYmin](#) (void) const  
*Get  $Y_{min}$  shadow domain.*
- [real\\_type](#) [getXmax](#) (void) const  
*Get  $X_{max}$  shadow domain.*
- [real\\_type](#) [getYmax](#) (void) const  
*Get  $Y_{max}$  shadow domain.*
- void [clear](#) (void)  
*Clear the bounding box domain.*
- void [print](#) ([ostream\\_type](#) &stream) const  
*Print bounding box domain.*
- void [updateBBox2D](#) ([vec3](#) const Vertices[3])  
*Update the bounding box domain with three input vertices.*

### 6.1.1 Detailed Description

2D Bounding Box class

### 6.1.2 Constructor & Destructor Documentation

#### 6.1.2.1 BBox2D()

```
TireGround::RDF::BBox2D::BBox2D (
    vec3 const Vertices[3] ) [inline]
```

Variable set constructor.

Parameters

<i>Vertices</i>	Vertices reference vector
-----------------	---------------------------

### 6.1.3 Member Function Documentation

#### 6.1.3.1 print()

```
void TireGround::RDF::BBox2D::print (
    ostream_type & stream ) const [inline]
```

Print bounding box domain.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

#### 6.1.3.2 updateBBox2D()

```
void TireGround::RDF::BBox2D::updateBBox2D (
    vec3 const Vertices[3] )
```

Update the bounding box domain with three input vertices.

Parameters

<i>Vertices</i>	Vertices reference vector
-----------------	---------------------------

The documentation for this class was generated from the following file:

- include/RoadRDF.hh

## 6.2 TireGround::Disk Class Reference

[Tire](#) disk.

```
#include <PatchTire.hh>
```

## Public Member Functions

- [Disk](#) ([Disk](#) &&)=default  
*Enable && operator.*
- [Disk](#) ()  
*Default constructor.*
- [Disk](#) ([vec2](#) const &\_OriginXZ, [real\\_type](#) \_OffsetY, [real\\_type](#) \_Radius)  
*Variable set constructor.*
- void [set](#) ([Disk](#) const &in)  
*Copy the [Disk](#) object.*
- void [setOriginXZ](#) ([vec2](#) const &\_OriginXZ)  
*Set origin on XZ plane.*
- [vec2](#) const & [getOriginXZ](#) (void) const  
*Get origin vector XZ-axes coordinates.*
- [vec3](#) [getOriginXYZ](#) (void) const  
*Get origin vector XYZ-axes coordinates.*
- [real\\_type](#) [getOffsetY](#) (void) const  
*Get origin Y-axis coordinate.*
- [real\\_type](#) [getRadius](#) (void) const  
*Get [Disk](#) radius.*
- void [contactTriangles](#) ([RDF::TriangleRoad\\_list](#) const &TriList, [ReferenceFrame](#) const &RF, [vec3](#) &Normal, [real\\_type](#) &Friction, [real\\_type](#) &Area) const
- void [contactPlane](#) ([vec3](#) const &Normal, [vec3](#) const &Point, [ReferenceFrame](#) const &RF, [real\\_type](#) &Area) const
- void [pointOnDisk](#) ([vec3](#) const &Normal, [ReferenceFrame](#) const &RF, [vec3](#) &DiskPoint, [vec3](#) &NormalOnDisk) const  
*Get the points on [Disk](#) the circumference and on a given plane.*
- [real\\_type](#) [segmentArea](#) ([real\\_type](#) const Length) const
- bool [isPointInside](#) ([vec2](#) const &Point) const  
*Check if a point in [Disk](#) reference frame is inside or outside the [Disk](#).*
- [real\\_type](#) [y](#) ([real\\_type](#) const x) const  
*Evaluate Y at a query X value on the lower side [Disk](#) circumference.*
- [real\\_type](#) [segmentLength](#) ([vec2](#) const Point1, [vec2](#) const Point2) const  
*Evaluate a generic segment length given 2 points on the [Disk](#) circumference.*
- [int\\_type](#) [intersectSegment](#) ([vec2](#) const &Point1, [vec2](#) const &Point2, [vec2](#) &Intersect1, [vec2](#) &Intersect2) const
- bool [intersectPlane](#) ([vec3](#) const &Plane\_Normal, [vec3](#) const &Plane\_Point, [vec3](#) &Line\_↵ Direction, [vec3](#) &Line\_Point) const
- [real\\_type](#) [getLineArea](#) ([vec2](#) const &Point1\_XZ, [vec2](#) const &Point2\_XZ) const  
*Get a two points line segment area [ m<sup>2</sup> ] (as ouput) inside the [Disk](#).*

### 6.2.1 Detailed Description

[Tire](#) disk.

### 6.2.2 Constructor & Destructor Documentation

### 6.2.2.1 Disk()

```
TireGround::Disk::Disk (
    vec2 const & _OriginXZ,
    real_type _OffsetY,
    real_type _Radius ) [inline]
```

Variable set constructor.

Parameters

<i>_OriginXZ</i>	$(X_0, Z_0)$ origin coordinate
<i>_OffsetY</i>	$Y_0$ origin coordinate (offset from center)
<i>_Radius</i>	Radius

## 6.2.3 Member Function Documentation

### 6.2.3.1 contactPlane()

```
void TireGround::Disk::contactPlane (
    vec3 const & Normal,
    vec3 const & Point,
    ReferenceFrame const & RF,
    real_type & Area ) const
```

Get the contact area [  $m^2$  ] inside the single [Disk](#) given a plane in absolute reference frame

Parameters

<i>Normal</i>	Plane normal in absolute reference frame
<i>Point</i>	Plane point in absolute reference frame
<i>RF</i>	<a href="#">Tire ReferenceFrame</a>
<i>Area</i>	Contact area [ $m^2$ ]

### 6.2.3.2 contactTriangles()

```
void TireGround::Disk::contactTriangles (
    RDF::TriangleRoad_list const & TriList,
    ReferenceFrame const & RF,
    vec3 & Normal,
    real_type & Friction,
    real_type & Area ) const
```

Get area weighted mean road normal versor, area weighted mean friction and contact area [  $m^2$  ] inside the single [Disk](#) of segments described by the intersection of triangles on  $XZ$ -plane

Parameters

<i>TriList</i>	<a href="#">Shadow</a> / MeshSurface intersected triangles
<i>RF</i>	<a href="#">Tire ReferenceFrame</a>
<i>Normal</i>	Area weighted mean road normal versor

## Parameters

<i>Friction</i>	Area weighted mean contact friction
<i>Area</i>	Contact area [ $m^2$ ]

## 6.2.3.3 getLineArea()

```
real_type TireGround::Disk::getLineArea (
    vec2 const & Point1_XZ,
    vec2 const & Point2_XZ ) const
```

Get a two points line segment area [  $m^2$  ] (as ouput) inside the [Disk](#).

## Parameters

<i>Point1_XZ</i>	Point 1 in <a href="#">Disk</a> reference frame
<i>Point2_XZ</i>	Point 2 in <a href="#">Disk</a> reference frame

## 6.2.3.4 intersectPlane()

```
bool TireGround::Disk::intersectPlane (
    vec3 const & Plane_Normal,
    vec3 const & Plane_Point,
    vec3 & Line_Direction,
    vec3 & Line_Point ) const
```

Check if two plane intersects and find the intersecting rect given two points in [Disk](#) reference frame

## Parameters

<i>Plane_Normal</i>	Plane normal vector in <a href="#">Disk</a> reference frame
<i>Plane_Point</i>	Plane known point in <a href="#">Disk</a> reference frame
<i>Line_Direction</i>	Rect direction vector in <a href="#">Disk</a> reference frame
<i>Line_Point</i>	Plane known point in <a href="#">Disk</a> reference frame

## 6.2.3.5 intersectSegment()

```
int_type TireGround::Disk::intersectSegment (
    vec2 const & Point1,
    vec2 const & Point2,
    vec2 & Intersect1,
    vec2 & Intersect2 ) const
```

Find the intersection points between the [Disk](#) and a two points line segment in [Disk](#) reference frame (output integer gives number of intersection points)

## Parameters

<i>Point1</i>	Line segment point 1 in <a href="#">Disk</a> reference frame
---------------	--

## Parameters

<i>Point2</i>	Line segment point 2 in <a href="#">Disk</a> reference frame
<i>Intersect1</i>	Intersection point 1 in <a href="#">Disk</a> reference frame
<i>Intersect2</i>	Intersection point 2 in <a href="#">Disk</a> reference frame

## 6.2.3.6 isPointInside()

```
bool TireGround::Disk::isPointInside (
    vec2 const & Point ) const
```

Check if a point in [Disk](#) reference frame is inside or outside the [Disk](#).

## Parameters

<i>Point</i>	Query point in <a href="#">Disk</a> reference frame
--------------	---

## 6.2.3.7 segmentArea()

```
real\_type TireGround::Disk::segmentArea (
    real\_type const Length ) const [inline]
```

Get the contact patch area under the intersection plane in absolute reference frame [  $m^2$  ]

## Parameters

<i>Length</i>	Chord length
---------------	--------------

## 6.2.3.8 segmentLength()

```
real\_type TireGround::Disk::segmentLength (
    vec2 const Point1,
    vec2 const Point2 ) const [inline]
```

Evaluate a generic segment length given 2 points on the [Disk](#) circumference.

## Parameters

<i>Point1</i>	Point 1
<i>Point2</i>	Point 2

## 6.2.3.9 set()

```
void TireGround::Disk::set (
    Disk const & in ) [inline]
```

Copy the [Disk](#) object.

## Parameters

<i>in</i>	Disk object to be copied
-----------	--------------------------

## 6.2.3.10 setOriginXZ()

```
void TireGround::Disk::setOriginXZ (
    vec2 const & _OriginXZ ) [inline]
```

Set origin on  $XZ$  plane.

## Parameters

_OriginXZ	New origin on $XZ$ plane
-----------	--------------------------

## 6.2.3.11 y()

```
real_type TireGround::Disk::y (
    real_type const x ) const [inline]
```

Evaluate  $Y$  at a query  $X$  value on the lower side Disk circumference.

## Parameters

$x$	Query $X$ value
-----	-----------------

The documentation for this class was generated from the following file:

- include/PatchTire.hh

## 6.3 TireGround::ETRTO Class Reference

Tire ETRTO denomination.

```
#include <PatchTire.hh>
```

## Public Member Functions

- ETRTO ()  
*Default constructor.*
- ETRTO (real\_type \_SectionWidth, real\_type \_AspectRatio, real\_type \_RimDiameter)  
*Variable set constructor.*
- real\_type getSidewallHeight (void) const  
*Get sidewall height [ m ].*
- real\_type getTireDiameter (void) const  
*Get external tire diameter [ m ].*
- real\_type getTireRadius (void) const  
*Get external tire radius [ m ].*
- real\_type getSectionWidth (void) const

*Get section width [ m].*

- void `print` (`ostream_type` &stream) const

*Display tire data.*

### 6.3.1 Detailed Description

`Tire` ETRTO denomination.

### 6.3.2 Constructor & Destructor Documentation

#### 6.3.2.1 ETRTO()

```
TireGround::ETRTO::ETRTO (
    real_type _SectionWidth,
    real_type _AspectRatio,
    real_type _RimDiameter ) [inline]
```

Variable set constructor.

Parameters

<code>_SectionWidth</code>	<code>Tire</code> section width [ m]
<code>_AspectRatio</code>	<code>Tire</code> aspect ratio [ %]
<code>_RimDiameter</code>	Rim diameter [ in]

### 6.3.3 Member Function Documentation

#### 6.3.3.1 print()

```
void TireGround::ETRTO::print (
    ostream_type & stream ) const [inline]
```

Display tire data.

Parameters

<code>stream</code>	Output stream type
---------------------	--------------------

The documentation for this class was generated from the following file:

- include/PatchTire.hh

## 6.4 TireGround::MagicFormula Class Reference

Pacejka `MagicFormula` contact model.

```
#include <PatchTire.hh>
```

Inheritance diagram for TireGround::MagicFormula:

Collaboration diagram for TireGround::MagicFormula:

## Public Member Functions

### 6.4.1 Detailed Description

Pacejka [MagicFormula](#) contact model.

### 6.4.2 Constructor & Destructor Documentation

#### 6.4.2.1 MagicFormula()

```
TireGround::MagicFormula::MagicFormula (
    real\_type const SectionWidth,
    real\_type const AspectRatio,
    real\_type const RimDiameter,
    int\_type const SwitchN ) [inline]
```

Variable set constructor.

## Parameters

<i>SectionWidth</i>	<a href="#">Tire</a> section width [ <i>m</i> ]
<i>AspectRatio</i>	<a href="#">Tire</a> aspect ratio [ % ]
<i>RimDiameter</i>	Rim diameter [ <i>in</i> ]
<i>SwitchN</i>	Maximum RoadTriangles in the <a href="#">Tire Shadow</a> (switch to sampling)

## 6.4.3 Member Function Documentation

## 6.4.3.1 evaluateContact()

```
void TireGround::MagicFormula::evaluateContact (
    RDF::TriangleRoad\_list const & TriList ) [override], [protected], [virtual]
```

Evaluate contact with RoadTriangles.

## Parameters

<i>TriList</i>	Shadow / MeshSurface intersected triangles
----------------	--

Implements [TireGround::Tire](#).

## 6.4.3.2 fourPointsSampling()

```
void TireGround::MagicFormula::fourPointsSampling (
    RDF::TriangleRoad\_list const & TriList,
    vec3 & P_star ) [protected]
```

Perform triangles sampling on 4 points at  $\pm 0.1 \cdot R$  along *X* and  $\pm 0.3 \cdot W$  along *Y*.

## Parameters

<i>TriList</i>	Shadow / MeshSurface intersected triangles
----------------	--

## 6.4.3.3 getArea() [1/2]

```
void TireGround::MagicFormula::getArea (
    real\_type & _Area ) const [inline], [override], [virtual]
```

Get approximated contact area on [Disk](#) plane [ *m*<sup>2</sup> ].

## Parameters

<i>_Area</i>	Contact area [ <i>m</i> <sup>2</sup> ]
--------------	--

Implements [TireGround::Tire](#).

## 6.4.3.4 getArea() [2/2]

```
void TireGround::MagicFormula::getArea (
    row_vecN & _Area ) const [inline], [override], [virtual]
```

Get approximated contact area vector on [Disk](#) plane [  $m^2$  ].

Parameters

<code>_Area</code>	Contact area vector [ $m^2$ ]
--------------------	-------------------------------

Implements [TireGround::Tire](#).

## 6.4.3.5 getEulerAngleX()

```
real_type TireGround::Tire::getEulerAngleX (
    void ) const [inline], [inherited]
```

Get current Euler angles [  $rad$  ] for  $X$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

## 6.4.3.6 getEulerAngleY()

```
real_type TireGround::Tire::getEulerAngleY (
    void ) const [inline], [inherited]
```

Get current Euler angles [  $rad$  ] for  $Y$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

## 6.4.3.7 getEulerAngleZ()

```
real_type TireGround::Tire::getEulerAngleZ (
    void ) const [inline], [inherited]
```

Get current Euler angles [  $rad$  ] for  $Z$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

## 6.4.3.8 getFriction() [1/2]

```
void TireGround::MagicFormula::getFriction (
    real_type & _Friction ) const [inline], [override], [virtual]
```

Get contact point friction.

Parameters

<code>_Friction</code>	Contact point friction
------------------------	------------------------

Implements [TireGround::Tire](#).

## 6.4.3.9 getFriction() [2/2]

```
void TireGround::MagicFormula::getFriction (
    row_vecN & _Friction ) const [inline], [override], [virtual]
```

Get contact point friction vector.

## Parameters

<i>_Friction</i>	Contact point friction vector
------------------	-------------------------------

Implements [TireGround::Tire](#).

## 6.4.3.10 getMFpoint() [1/2]

```
void TireGround::MagicFormula::getMFpoint (
    vec3 & _DiskPoint ) const [inline], [override], [virtual]
```

Get Magic Formula contact point.

## Parameters

<i>_DiskPoint</i>	Magic Formula contact point
-------------------	-----------------------------

Implements [TireGround::Tire](#).

## 6.4.3.11 getMFpoint() [2/2]

```
void TireGround::MagicFormula::getMFpoint (
    row_vec3 & _DiskPoint ) const [inline], [override], [virtual]
```

Get Magic Formula contact point vector.

## Parameters

<i>_DiskPoint</i>	Contact point vector on <a href="#">Disk</a>
-------------------	--

Implements [TireGround::Tire](#).

## 6.4.3.12 getMFpointRF() [1/2]

```
void TireGround::MagicFormula::getMFpointRF (
    mat4 & PointRF ) const [override], [virtual]
```

Get Magic Formula contact point reference frame with 4x4 transformation matrix.

## Parameters

<i>PointRF</i>	Magic Formula contact point reference frame
----------------	---

Implements [TireGround::Tire](#).

## 6.4.3.13 getMFpointRF() [2/2]

```
void TireGround::MagicFormula::getMFpointRF (
    row_mat4 & _MFpointRF ) const [inline], [override], [virtual]
```

Get Magic Formula contact point reference frame vector with 4x4 transformation matrix.

## Parameters

<i>_MFpointRF</i>	Magic Formula ontact point reference frames vector
-------------------	--

Implements [TireGround::Tire](#).

## 6.4.3.14 getNormal() [1/2]

```
void TireGround::MagicFormula::getNormal (
    vec3 & _Normal ) const [inline], [override], [virtual]
```

Get contact normal versor.

## Parameters

<i>_Normal</i>	Contact point normal versor
----------------	-----------------------------

Implements [TireGround::Tire](#).

## 6.4.3.15 getNormal() [2/2]

```
void TireGround::MagicFormula::getNormal (
    row_vec3 & _Normal ) const [inline], [override], [virtual]
```

Get contact normal versors vector.

## Parameters

<i>_Normal</i>	Contact point normal direction vector
----------------	---------------------------------------

Implements [TireGround::Tire](#).

## 6.4.3.16 getRelativeCamber()

```
void TireGround::Tire::getRelativeCamber (
    real_type & RelativeCamber ) const [inherited]
```

Get relative camber angle [ *rad*].

## Parameters

<i>RelativeCamber</i>	Relative camber angle
-----------------------	-----------------------

## 6.4.3.17 getRho() [1/2]

```
void TireGround::MagicFormula::getRho (
    real_type & Rho ) const [inline], [override], [virtual]
```

Get contact depth at center point [ *m*]

Warning: (if negative the tire does not touch the ground)!

## Parameters

<i>Rho</i>	Depth at center point
------------	-----------------------

Implements [TireGround::Tire](#).

## 6.4.3.18 getRho() [2/2]

```
void TireGround::MagicFormula::getRho (
    row_vecN & Rho ) const [inline], [override], [virtual]
```

Get contact depth matrix [ *m*]

Warning: (if negative the tire does not touch the ground)!

## Parameters

<i>Rho</i>	Depth matrix
------------	--------------

Implements [TireGround::Tire](#).

## 6.4.3.19 getRhoDot() [1/2]

```
void TireGround::MagicFormula::getRhoDot (
    real_type const & Rho,
    real_type const & Time,
    real_type & RhoDot ) const [inline], [override], [virtual]
```

Get contact depth time derivative [ *m/s*].

## Parameters

<i>Rho</i>	Previous time step Rho [ <i>m</i> ]
<i>Time</i>	Time step [ <i>s</i> ]
<i>RhoDot</i>	Penetration derivative [ <i>m/s</i> ]

Implements [TireGround::Tire](#).

## 6.4.3.20 getRhoDot() [2/2]

```
void TireGround::MagicFormula::getRhoDot (
    row_vecN const & Rho,
    real_type const & Time,
    row_vecN & RhoDot ) const [inline], [override], [virtual]
```

Get contact depth time derivative vector [ *m/s*].

## Parameters

<i>Rho</i>	Previous time step Rho [ <i>m</i> ]
<i>Time</i>	Time step [ <i>s</i> ]
<i>RhoDot</i>	Penetration derivative [ <i>m/s</i> ]

Implements [TireGround::Tire](#).

#### 6.4.3.21 getVolume() [1/2]

```
void TireGround::MagicFormula::getVolume (
    real_type & _Volume ) const [inline], [override], [virtual]
```

Get approximated contact volume [  $m^3$  ].

Parameters

<i>_Volume</i>	Contact volume [ $m^3$ ]
----------------	--------------------------

Implements [TireGround::Tire](#).

#### 6.4.3.22 getVolume() [2/2]

```
void TireGround::MagicFormula::getVolume (
    row_vecN & Volume ) const [inline], [override], [virtual]
```

Get approximated contact volume vector [  $m^3$  ].

Parameters

<i>Volume</i>	Contact volume vector [ $m^3$ ]
---------------	---------------------------------

Implements [TireGround::Tire](#).

#### 6.4.3.23 pointSampling()

```
bool TireGround::Tire::pointSampling (
    RDF::TriangleRoad_list const & TriList,
    vec3 const & RayOrigin,
    vec3 const & RayDirection,
    vec3 & SampledPt,
    real_type & TriFriction = quietNaN,
    vec3 & TriNormal = vec3_NaN ) const [protected], [inherited]
```

Perform one point sampling (ray-triangle intersection)

Parameters

<i>TriList</i>	Shadow/MeshSurface intersected triangles
<i>RayOrigin</i>	Ray origin
<i>RayDirection</i>	Ray direction
<i>SampledPt</i>	Intersection point
<i>TriFriction</i>	Intersected triangle friction
<i>TriNormal</i>	Intersected triangle normal

## 6.4.3.24 print()

```
void TireGround::MagicFormula::print (
    ostream_type & stream ) const [override], [virtual]
```

Print contact parameters.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

Implements [TireGround::Tire](#).

## 6.4.3.25 printETRTOGeometry()

```
void TireGround::Tire::printETRTOGeometry (
    ostream_type & stream ) const [inline], [inherited]
```

Display [Tire ETRTO](#) geometry data.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

## 6.4.3.26 setOrigin()

```
void TireGround::Tire::setOrigin (
    vec3 const & Origin ) [inline], [inherited]
```

Set a new tire origin.

Parameters

<i>Origin</i>	<a href="#">Tire</a> origin
---------------	-----------------------------

## 6.4.3.27 setReferenceFrame()

```
void TireGround::Tire::setReferenceFrame (
    ReferenceFrame const & _RF ) [inline], [inherited]
```

Copy the tire [ReferenceFrame](#) object

Warning: Rotation matrix must be orthonormal!

Parameters

<i>_RF</i>	<a href="#">ReferenceFrame</a> object to be copied
------------	--

## 6.4.3.28 setRotationMatrix()

```
void TireGround::Tire::setRotationMatrix (
```

```
mat3 const & RotationMatrix ) [inline], [inherited]
```

Set a new 3x3 rotation matrix

Warning: Rotation matrix must be orthonormal!

Parameters

<i>RotationMatrix</i>	Rotation matrix
-----------------------	-----------------

#### 6.4.3.29 setTotalTransformationMatrix()

```
void TireGround::Tire::setTotalTransformationMatrix (
    mat4 const & TM ) [inline], [inherited]
```

Set 4x4 total transformation matrix

Warning: Rotation matrix must be orthonormal!

Parameters

<i>TM</i>	4x4 total transformation matrix
-----------	---------------------------------

#### 6.4.3.30 setup()

```
bool TireGround::MagicFormula::setup (
    RDF::MeshSurface & Mesh,
    mat4 const & TM ) [override], [virtual]
```

Update current tire position and find contact parameters.

Parameters

<i>Mesh</i>	MeshSurface object (road)
<i>TM</i>	4x4 total transformation matrix

Implements [TireGround::Tire](#).

The documentation for this class was generated from the following file:

- include/PatchTire.hh

## 6.5 TireGround::RDF::MeshSurface Class Reference

Mesh surface.

```
#include <RoadRDF.hh>
```

### 6.5.1 Detailed Description

Mesh surface.

### 6.5.2 Constructor & Destructor Documentation

#### 6.5.2.1 [MeshSurface](#)() [1/2]

```
TireGround::RDF::MeshSurface::MeshSurface (
    TriangleRoad\_list const & _PtrTriangleVec ) [inline]
```

Variable set constructor.

Parameters

<a href="#">_PtrTriangleVec</a>	Road triangles pointer vector list
---------------------------------	------------------------------------

#### 6.5.2.2 [MeshSurface](#)() [2/2]

```
TireGround::RDF::MeshSurface::MeshSurface (
    std::string const & Path ) [inline]
```

Variable set constructor.

Parameters

<a href="#">Path</a>	Path to the <a href="#">RDF</a> file
----------------------	--------------------------------------

## 6.5.3 Member Function Documentation

### 6.5.3.1 intersectAABBtree()

```
bool TireGround::RDF::MeshSurface::intersectAABBtree (
    G2lib::AABBtree::PtrAABB const & AABBTreePtr,
    RDF::TriangleRoad_list & TrianglesList ) const
```

Intersect the mesh AABB tree with an external AABB tree.

Parameters

<i>AABBTreePtr</i>	External AABBtree object pointer
<i>TrianglesList</i>	Intersected <a href="#">TriangleRoad</a> vector list

### 6.5.3.2 intersectBBox()

```
bool TireGround::RDF::MeshSurface::intersectBBox (
    std::vector< G2lib::BBox::PtrBBox > const & BBoxPtr,
    RDF::TriangleRoad_list & TrianglesList ) const
```

Update the mesh AABBtree with an external G2lib::BBox object pointer vector.

Parameters

<i>BBoxPtr</i>	External G2lib::BBox object pointer vector
<i>TrianglesList</i>	Intersected <a href="#">TriangleRoad</a> vector list

### 6.5.3.3 LoadFile()

```
bool TireGround::RDF::MeshSurface::LoadFile (
    std::string const & Path )
```

Load the [RDF](#) model and print information on a file.

Parameters

<i>Path</i>	Path to the <a href="#">RDF</a> file
-------------	--------------------------------------

### 6.5.3.4 printData()

```
void TireGround::RDF::MeshSurface::printData (
    std::string const & FileName ) const
```

Print data in file.

Parameters

<i>FileName</i>	File name in which print data
-----------------	-------------------------------

### 6.5.3.5 set()

```
void TireGround::RDF::MeshSurface::set (
    MeshSurface const & in ) [inline]
```

Copy the [MeshSurface](#) object.

Parameters

<i>in</i>	<a href="#">MeshSurface</a> object to be copied
-----------	---

*Get Magic Formula contact point reference frames vector with 4x4 transformation matrix.*
- void [getDiskMFpointRF](#) ([int\\_type](#) const i, [mat4](#) &PointRF) const

Get *Disk Magic Formula* contact point reference frame with 4x4 transformation matrix.

- void `getRho` (`real_type` &Rho) const override
- void `getRho` (`row_vecN` &Rho) const override
- void `getDiskRho` (`int_type` const i, `real_type` &Rho) const
- void `getRhoDot` (`real_type` const &Rho, `real_type` const &Time, `real_type` &RhoDot) const override

Get contact depth time derivative [ m/s ].

- void `getRhoDot` (`row_vecN` const &Rho, `real_type` const &Time, `row_vecN` &RhoDot) const override

Get contact depths derivative vector [ m/s ].

- void `getDiskRhoDot` (`int_type` const i, `real_type` const &Rho, `real_type` const &Time, `real_type` &RhoDot) const

Get *i*-th *Disk* contact depth derivative [ m/s ].

- void `getArea` (`real_type` &\_Area) const override

Get approximated mean contact area on *Disk* plane [ m<sup>2</sup> ].

- void `getArea` (`row_vecN` &\_AreaVec) const override

Get approximated contact areas vector on *Disk* plane [ m<sup>2</sup> ].

- void `getVolume` (`real_type` &Volume) const override

Get approximated contact volume [ m<sup>3</sup> ].

- void `getVolume` (`row_vecN` &Volume) const override

Get approximated contact volumes vector [ m<sup>3</sup> ].

- bool `setup` (`RDF::MeshSurface` &Mesh, `mat4` const &TM) override

Update current tire position and find contact parameters.

- void `print` (`ostream_type` &stream) const override

Print contact parameters.

- void `printETRTOGeometry` (`ostream_type` &stream) const

Display *Tire ETRTO* geometry data.

- `G2lib::AABBtree::PtrAABB` const `getAABBtree` (void) const

Get total *Tire Shadow* `G2Lib::AABBtree` (3D projection on ground)

- `G2lib::AABBtree::PtrAABB` const `getUpperSideAABBtree` (void) const

Get upper side *Tire Shadow* `G2Lib::AABBtree` (3D projection on ground)

- `G2lib::AABBtree::PtrAABB` const `getLowerSideAABBtree` (void) const

Get lower side *Tire Shadow* `G2Lib::AABBtree` (3D projection on ground)

- void `setReferenceFrame` (`ReferenceFrame` const &\_RF)

- `ReferenceFrame` const & `getReferenceFrame` (void) const

Get tire *ReferenceFrame* object.

- void `setOrigin` (`vec3` const &Origin)

Set a new tire origin.

- void `setRotationMatrix` (`mat3` const &RotationMatrix)

- void `setTotalTransformationMatrix` (`mat4` const &TM)

- `real_type` `getEulerAngleX` (void) const

- `real_type` `getEulerAngleY` (void) const

- `real_type` `getEulerAngleZ` (void) const

- void `getRelativeCamber` (`real_type` &RelativeCamber) const

Get relative camber angle [ rad ].

- `int_type` `getDisksNumber` (void) const

Dimension of the contact points data structure (disks number)

### 6.6.1 Detailed Description

Multi-disk tire contact model.

### 6.6.2 Constructor & Destructor Documentation

#### 6.6.2.1 MultiDisk() [1/3]

```
TireGround::MultiDisk::MultiDisk (
    real\_type const SectionWidth,
    real\_type const AspectRatio,
    real\_type const RimDiameter,
    int\_type const PointsN,
    int\_type const DisksN,
    int\_type const SwitchN ) [inline]
```

Variable set constructor.

#### Parameters

<i>SectionWidth</i>	<a href="#">Tire</a> section width [ <i>m</i> ]
<i>AspectRatio</i>	<a href="#">Tire</a> aspect ratio [ %]
<i>RimDiameter</i>	Rim diameter [ <i>in</i> ]
<i>PointsN</i>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<i>DisksN</i>	Number of Disks (divisions on <i>Y</i> -axis −1)
<i>SwitchN</i>	Maximum RoadTriangles in the <a href="#">Tire Shadow</a> (switch to sampling)

#### 6.6.2.2 MultiDisk() [2/3]

```
TireGround::MultiDisk::MultiDisk (
    real\_type const SectionWidth,
    real\_type const AspectRatio,
```

```

real_type const RimDiameter,
real_type const SideRadius,
int_type const PointsN,
int_type const DisksN,
int_type const SwitchN ) [inline]

```

Variable set constructor.

Parameters

<i>SectionWidth</i>	<a href="#">Tire</a> section width [ <i>m</i> ]
<i>AspectRatio</i>	<a href="#">Tire</a> aspect ratio [ % ]
<i>RimDiameter</i>	Rim diameter [ <i>in</i> ]
<i>SideRadius</i>	Sidewall radius [ <i>m</i> ]
<i>PointsN</i>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<i>DisksN</i>	Number of Disks (divisions on <i>Y</i> -axis – 1)
<i>SwitchN</i>	Maximum RoadTriangles in the <a href="#">Tire Shadow</a> (switch to sampling)

### 6.6.2.3 MultiDisk() [3/3]

```

TireGround::MultiDisk::MultiDisk (
    real_type const SectionWidth,
    real_type const AspectRatio,
    real_type const RimDiameter,
    row_vecN const DisksRadius,
    int_type const PointsN,
    int_type const SwitchN ) [inline]

```

Variable set constructor.

Parameters

<i>SectionWidth</i>	<a href="#">Tire</a> section width [ <i>m</i> ]
<i>AspectRatio</i>	<a href="#">Tire</a> aspect ratio [ % ]
<i>RimDiameter</i>	Rim diameter [ <i>in</i> ]
<i>DisksRadius</i>	Disks radius vector [ <i>m</i> ]
<i>PointsN</i>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<i>SwitchN</i>	Maximum RoadTriangles in the <a href="#">Tire Shadow</a> (switch to sampling)

## 6.6.3 Member Function Documentation

### 6.6.3.1 getArea() [1/2]

```

void TireGround::MultiDisk::getArea (
    real_type & _Area ) const [inline], [override], [virtual]

```

Get approximated mean contact area on [Disk](#) plane [ *m*<sup>2</sup> ].

## Parameters

<i>_Area</i>	Contact area [ $m^2$ ]
--------------	------------------------

Implements [TireGround::Tire](#).

## 6.6.3.2 getArea() [2/2]

```
void TireGround::MultiDisk::getArea (
    row_vecN & _AreaVec ) const [inline], [override], [virtual]
```

Get approximated contact areas vector on [Disk](#) plane [  $m^2$  ].

## Parameters

<i>_AreaVec</i>	Contact areas vector [ $m^2$ ]
-----------------	--------------------------------

Implements [TireGround::Tire](#).

## 6.6.3.3 getDiskFriction()

```
void TireGround::MultiDisk::getDiskFriction (
    int_type const i,
    real_type & _Friction ) const [inline]
```

Get  $i$ -th [Disk](#) contact friction.

## Parameters

$i$	$i$ -th <a href="#">Disk</a>
<i>_Friction</i>	<a href="#">Disk</a> contact friction

## 6.6.3.4 getDiskMFpoint()

```
void TireGround::MultiDisk::getDiskMFpoint (
    int_type const i,
    vec3 & _DiskPoint ) const [inline]
```

Get  $i$ -th [Disk](#) Magic Formula contact point.

## Parameters

$i$	$i$ -th <a href="#">Disk</a>
<i>_DiskPoint</i>	<a href="#">Disk</a> Magic Formula contact point

## 6.6.3.5 getDiskMFpointRF()

```
void TireGround::MultiDisk::getDiskMFpointRF (
    int_type const i,
    mat4 & PointRF ) const [inline]
```

Get [Disk](#) Magic Formula contact point reference frame with 4x4 transformation matrix.

Parameters

<i>i</i>	<i>i</i> -th <a href="#">Disk</a>
<i>PointRF</i>	Magic Formula contact point reference frame

#### 6.6.3.6 `getDiskNormal()`

```
void TireGround::MultiDisk::getDiskNormal (
    int_type const i,
    vec3 & _Normal ) const [inline]
```

Get *i*-th [Disk](#) contact normal versor.

Parameters

<i>i</i>	<i>i</i> -th <a href="#">Disk</a>
<i>_Normal</i>	Contact normal versor

#### 6.6.3.7 `getDiskOriginXYZ()` [1/2]

```
void TireGround::MultiDisk::getDiskOriginXYZ (
    row_vec3 & Origin ) const [inline]
```

Get disks origin (*X*, *Y*, *Z*).

Parameters

<i>Origin</i>	Disks origin
---------------	--------------

#### 6.6.3.8 `getDiskOriginXYZ()` [2/2]

```
void TireGround::MultiDisk::getDiskOriginXYZ (
    int_type const i,
    vec3 & Origin ) const [inline]
```

Get *i*-th [Disk](#) origin (*X*, *Y*, *Z*).

Parameters

<i>i</i>	<i>i</i> -th <a href="#">Disk</a>
<i>Origin</i>	Disks origin

#### 6.6.3.9 `getDiskRho()`

```
void TireGround::MultiDisk::getDiskRho (
    int_type const i,
```

```
real_type & Rho ) const [inline]
```

Get  $i$ -th [Disk](#) contact depth [  $m$  ]

Warning: (if negative the tire does not touch the ground)!

Parameters

$i$	$i$ -th <a href="#">Disk</a>
$Rho$	<a href="#">Disk</a> contact depth

#### 6.6.3.10 getDiskRhoDot()

```
void TireGround::MultiDisk::getDiskRhoDot (
    int_type const i,
    real_type const & Rho,
    real_type const & Time,
    real_type & RhoDot ) const [inline]
```

Get  $i$ -th [Disk](#) contact depth derivative [  $m/s$  ].

Parameters

$i$	$i$ -th <a href="#">Disk</a>
$Rho$	Previous time step Rho [ $m$ ]
$Time$	Time step [ $s$ ]
$RhoDot$	<a href="#">Disk</a> contact depth derivative [ $m/s$ ]

#### 6.6.3.11 getEulerAngleX()

```
real_type TireGround::Tire::getEulerAngleX (
    void ) const [inline], [inherited]
```

Get current Euler angles [  $rad$  ] for  $X$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

#### 6.6.3.12 getEulerAngleY()

```
real_type TireGround::Tire::getEulerAngleY (
    void ) const [inline], [inherited]
```

Get current Euler angles [  $rad$  ] for  $Y$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

#### 6.6.3.13 getEulerAngleZ()

```
real_type TireGround::Tire::getEulerAngleZ (
    void ) const [inline], [inherited]
```

Get current Euler angles [  $rad$  ] for  $Z$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

#### 6.6.3.14 getFriction() [1/2]

```
void TireGround::MultiDisk::getFriction (  
    real_type & _Friction ) const [inline], [override], [virtual]
```

Get area weighted mean contact friction.

Parameters

<i>_Friction</i>	Area weighted mean contact friction
------------------	-------------------------------------

Implements [TireGround::Tire](#).

#### 6.6.3.15 getFriction() [2/2]

```
void TireGround::MultiDisk::getFriction (
    row_vecN & _Friction ) const [inline], [override], [virtual]
```

Get contact frictions vector.

Parameters

<i>_Friction</i>	Contact frictions vector
------------------	--------------------------

Implements [TireGround::Tire](#).

#### 6.6.3.16 getMFpoint() [1/2]

```
void TireGround::MultiDisk::getMFpoint (
    vec3 & _DiskPoint ) const [inline], [override], [virtual]
```

Get Magic Formula contact point.

Parameters

<i>_DiskPoint</i>	Magic Formula contact point
-------------------	-----------------------------

Implements [TireGround::Tire](#).

#### 6.6.3.17 getMFpoint() [2/2]

```
void TireGround::MultiDisk::getMFpoint (
    row_vec3 & _DiskPointVec ) const [inline], [override], [virtual]
```

Get Magic Formula contact points vector.

Parameters

<i>_DiskPointVec</i>	Magic Formula contact points vector
----------------------	-------------------------------------

Implements [TireGround::Tire](#).

#### 6.6.3.18 getMFpointRF() [1/2]

```
void TireGround::MultiDisk::getMFpointRF (
    mat4 & PointRF ) const [inline], [override], [virtual]
```

Get Magic Formula contact point reference frame with 4x4 transformation matrix.

## Parameters

<i>PointRF</i>	Magic Formula contact point reference frame
----------------	---

Implements [TireGround::Tire](#).

## 6.6.3.19 getMFpointRF() [2/2]

```
void TireGround::MultiDisk::getMFpointRF (
    row_mat4 & PointRF ) const [inline], [override], [virtual]
```

Get Magic Formula contact point reference frames vector with 4x4 transformation matrix.

## Parameters

<i>PointRF</i>	Magic Formula contact point reference frames vector
----------------	---

Implements [TireGround::Tire](#).

## 6.6.3.20 getNormal() [1/2]

```
void TireGround::MultiDisk::getNormal (
    vec3 & _Normal ) const [inline], [override], [virtual]
```

Get contact normal mean versor.

## Parameters

<i>_Normal</i>	Contact normal mean versor
----------------	----------------------------

Implements [TireGround::Tire](#).

## 6.6.3.21 getNormal() [2/2]

```
void TireGround::MultiDisk::getNormal (
    row_vec3 & _NormalVec ) const [inline], [override], [virtual]
```

Get contact normal versors vector.

## Parameters

<i>_NormalVec</i>	Contact normal versors vector
-------------------	-------------------------------

Implements [TireGround::Tire](#).

## 6.6.3.22 getRelativeCamber()

```
void TireGround::Tire::getRelativeCamber (
    real_type & RelativeCamber ) const [inherited]
```

Get relative camber angle [ *rad*].

## Parameters

<i>RelativeCamber</i>	Relative camber angle
-----------------------	-----------------------

## 6.6.3.23 getRho() [1/2]

```
void TireGround::MultiDisk::getRho (
    real_type & Rho ) const [inline], [override], [virtual]
```

Get contact depth at center point [ *m*]

Warning: (if negative the tire does not touch the ground)!

## Parameters

<i>Rho</i>	Depth at center point
------------	-----------------------

Implements [TireGround::Tire](#).

## 6.6.3.24 getRho() [2/2]

```
void TireGround::MultiDisk::getRho (
    row_vecN & Rho ) const [inline], [override], [virtual]
```

Get contact depths vector [ *m*]

Warning: (if negative the tire does not touch the ground)!

## Parameters

<i>Rho</i>	Contact depths vector
------------	-----------------------

Implements [TireGround::Tire](#).

## 6.6.3.25 getRhoDot() [1/2]

```
void TireGround::MultiDisk::getRhoDot (
    real_type const & Rho,
    real_type const & Time,
    real_type & RhoDot ) const [inline], [override], [virtual]
```

Get contact depth time derivative [ *m/s*].

## Parameters

<i>Rho</i>	Previous time step Rho [ <i>m</i> ]
<i>Time</i>	Time step [ <i>s</i> ]
<i>RhoDot</i>	Contact depth derivative [ <i>m/s</i> ]

Implements [TireGround::Tire](#).

## 6.6.3.26 getRhoDot() [2/2]

```
void TireGround::MultiDisk::getRhoDot (
    row_vecN const & Rho,
    real_type const & Time,
    row_vecN & RhoDot ) const [inline], [override], [virtual]
```

Get contact depths derivative vector [  $m/s$  ].

Parameters

<i>Rho</i>	Previous time step Rho [ $m$ ]
<i>Time</i>	Time step [ $s$ ]
<i>RhoDot</i>	Contact depths derivative vector [ $m/s$ ]

Implements [TireGround::Tire](#).

## 6.6.3.27 getVolume() [1/2]

```
void TireGround::MultiDisk::getVolume (
    real_type & Volume ) const [inline], [override], [virtual]
```

Get approximated contact volume [  $m^3$  ].

Parameters

<i>Volume</i>	Contact volume [ $m^3$ ]
---------------	--------------------------

Implements [TireGround::Tire](#).

## 6.6.3.28 getVolume() [2/2]

```
void TireGround::MultiDisk::getVolume (
    row_vecN & Volume ) const [inline], [override], [virtual]
```

Get approximated contact volumes vector [  $m^3$  ].

Parameters

<i>Volume</i>	Contact volumes vector [ $m^3$ ]
---------------	----------------------------------

Implements [TireGround::Tire](#).

## 6.6.3.29 pointSampling()

```
bool TireGround::Tire::pointSampling (
    RDF::TriangleRoad_list const & TriList,
    vec3 const & RayOrigin,
    vec3 const & RayDirection,
    vec3 & SampledPt,
    real_type & TriFriction = quietNaN,
    vec3 & TriNormal = vec3_NaN ) const [protected], [inherited]
```

Perform one point sampling (ray-triangle intersection)

Parameters

<i>TriList</i>	Shadow/MeshSurface intersected triangles
<i>RayOrigin</i>	Ray origin
<i>RayDirection</i>	Ray direction
<i>SampledPt</i>	Intersection point
<i>TriFriction</i>	Intersected triangle friction
<i>TriNormal</i>	Intersected triangle normal

### 6.6.3.30 print()

```
void TireGround::MultiDisk::print (
    ostream_type & stream ) const [override], [virtual]
```

Print contact parameters.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

Implements [TireGround::Tire](#).

### 6.6.3.31 printETRTOGeometry()

```
void TireGround::Tire::printETRTOGeometry (
    ostream_type & stream ) const [inline], [inherited]
```

Display [Tire ETRTO](#) geometry data.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

### 6.6.3.32 setDiskOriginXZ() [1/2]

```
void TireGround::MultiDisk::setDiskOriginXZ (
    row_vec2 & Origin ) [inline]
```

Set disks origin ( $X, Y, Z$ ).

Parameters

<i>Origin</i>	New Disks origin vector
---------------	-------------------------

## 6.6.3.33 setDiskOriginXZ() [2/2]

```
void TireGround::MultiDisk::setDiskOriginXZ (
    int_type const i,
    vec2 & Origin ) [inline]
```

Set  $i$ -th [Disk](#) origin ( $X, Y, Z$ ).

Parameters

$i$	$i$ -th <a href="#">Disk</a>
<i>Origin</i>	New Disks origin vector

## 6.6.3.34 setOrigin()

```
void TireGround::Tire::setOrigin (
    vec3 const & Origin ) [inline], [inherited]
```

Set a new tire origin.

Parameters

<i>Origin</i>	<a href="#">Tire</a> origin
---------------	-----------------------------

## 6.6.3.35 setReferenceFrame()

```
void TireGround::Tire::setReferenceFrame (
    ReferenceFrame const & _RF ) [inline], [inherited]
```

Copy the tire [ReferenceFrame](#) object

Warning: Rotation matrix must be orthonormal!

Parameters

<i>_RF</i>	<a href="#">ReferenceFrame</a> object to be copied
------------	--

## 6.6.3.36 setRotationMatrix()

```
void TireGround::Tire::setRotationMatrix (
    mat3 const & RotationMatrix ) [inline], [inherited]
```

Set a new 3x3 rotation matrix

Warning: Rotation matrix must be orthonormal!

Parameters

<i>RotationMatrix</i>	Rotation matrix
-----------------------	-----------------

## 6.6.3.37 setTotalTransformationMatrix()

```
void TireGround::Tire::setTotalTransformationMatrix (
    mat4 const & TM ) [inline], [inherited]
```

Set 4x4 total transformation matrix

Warning: Rotation matrix must be orthonormal!

Parameters

<i>TM</i>	4x4 total transformation matrix
-----------	---------------------------------

## 6.6.3.38 setup()

```
bool TireGround::MultiDisk::setup (
    RDF::MeshSurface & Mesh,
    mat4 const & TM ) [override], [virtual]
```

Update current tire position and find contact parameters.

Parameters

<i>Mesh</i>	MeshSurface object (road)
<i>TM</i>	4x4 total transformation matrix

Implements [TireGround::Tire](#).

The documentation for this class was generated from the following file:

- include/PatchTire.hh

## 6.7 TireGround::ReferenceFrame Class Reference

Reference frame.

```
#include <PatchTire.hh>
```

## Public Member Functions

### 6.7.1 Detailed Description

Reference frame.

### 6.7.2 Constructor & Destructor Documentation

#### 6.7.2.1 ReferenceFrame()

```
TireGround::ReferenceFrame::ReferenceFrame (
    vec3 const & _Origin,
    mat3 const & _RotationMatrix ) [inline]
```

Variable set constructor.

Parameters

<code>_Origin</code>	Origin position
<code>_RotationMatrix</code>	3x3 rotation matrix

### 6.7.3 Member Function Documentation

#### 6.7.3.1 getEulerAngleX()

```
real_type TireGround::ReferenceFrame::getEulerAngleX (
    void ) const
```

Get current Euler angles [ *rad*] for *X*-axis

Warning: Factor as  $[R_z][R_x][R_y]!$

#### 6.7.3.2 getEulerAngleY()

```
real_type TireGround::ReferenceFrame::getEulerAngleY (
    void ) const
```

Get current Euler angles [ *rad*] for *Y*-axis

Warning: Factor as  $[R_z][R_x][R_y]!$

#### 6.7.3.3 getEulerAngleZ()

```
real_type TireGround::ReferenceFrame::getEulerAngleZ (
    void ) const
```

Get current Euler angles [ *rad*] for *Z*-axis

Warning: Factor as  $[R_z][R_x][R_y]!$

#### 6.7.3.4 set()

```
void TireGround::ReferenceFrame::set (
    ReferenceFrame const & in ) [inline]
```

Copy the tire [ReferenceFrame](#) object

Warning: Rotation matrix must be orthonormal!

Parameters

<i>in</i>	<a href="#">ReferenceFrame</a> object to be copied
-----------	--

#### 6.7.3.5 setOrigin()

```
void TireGround::ReferenceFrame::setOrigin (
    vec3 const & _Origin ) [inline]
```

Set origin position.

Parameters

<i>_Origin</i>	Origin position
----------------	-----------------

#### 6.7.3.6 setRotationMatrix()

```
void TireGround::ReferenceFrame::setRotationMatrix (
    mat3 const & _RotationMatrix ) [inline]
```

Set 3x3 rotation matrix.

Parameters

<i>_RotationMatrix</i>	3x3 rotation matrix
------------------------	---------------------

#### 6.7.3.7 setTotalTransformationMatrix()

```
void TireGround::ReferenceFrame::setTotalTransformationMatrix (
    mat4 const & TM ) [inline]
```

Set 4x4 total transformation matrix.

## Parameters

<i>TM</i>	4x4 total transformation matrix
-----------	---------------------------------

The documentation for this class was generated from the following file:

- include/PatchTire.hh

## 6.8 TireGround::SamplingGrid Class Reference

Patch evaluation precision.

```
#include <PatchTire.hh>
```

### Public Member Functions

*Variable set constructor.*
- int\_type getPointsNumber (void) const  
*Get number of sampling points for each [Disk](#) (divisions on *X*-axis)*
- int\_type getDisksNumber (void) const  
*Get number of Disks (divisions on *Y*-axis – 1)*
- unsigned getSwitchNumber (void) const  
*Get number of maximum RoadTriangles in the [Tire Shadow](#) (switch to sampling)*
- void setSwitchNumber (int\_type const \_Switch)  
*Set number of maximum RoadTriangles in the [Tire Shadow](#) (switch to sampling)*
- void set (int\_type \_PointsN, int\_type \_DisksN, int\_type \_Switch)  
*Set number of divisions.*
- void set ([SamplingGrid](#) const &in)  
*Copy the [SamplingGrid](#) object.*

### 6.8.1 Detailed Description

Patch evaluation precision.

### 6.8.2 Constructor & Destructor Documentation

#### 6.8.2.1 SamplingGrid() [1/2]

```
TireGround::SamplingGrid::SamplingGrid (
    int_type _PointsN,
    int_type _DisksN ) [inline]
```

Variable set constructor.

## Parameters

<i>_PointsN</i>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<i>_DisksN</i>	Number of Disks (divisions on <i>Y</i> -axis – 1)

## 6.8.2.2 SamplingGrid() [2/2]

```
TireGround::SamplingGrid::SamplingGrid (
    int_type _PointsN,
    int_type _DisksN,
    int_type _Switch ) [inline]
```

Variable set constructor.

Parameters

<code>_PointsN</code>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<code>_DisksN</code>	Number of Disks (divisions on <i>Y</i> -axis –1)
<code>_Switch</code>	Maximum RoadTriangles in the <a href="#">Tire Shadow</a> (switch to sampling)

## 6.8.3 Member Function Documentation

## 6.8.3.1 set() [1/2]

```
void TireGround::SamplingGrid::set (
    int_type _PointsN,
    int_type _DisksN,
    int_type _Switch ) [inline]
```

Set number of divisions.

Parameters

<code>_PointsN</code>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<code>_DisksN</code>	Number of Disks (divisions on <i>Y</i> -axis –1)
<code>_Switch</code>	Maximum RoadTriangles in the <a href="#">Tire Shadow</a> (switch to sampling)

## 6.8.3.2 set() [2/2]

```
void TireGround::SamplingGrid::set (
    SamplingGrid const & in ) [inline]
```

Copy the [SamplingGrid](#) object.

Parameters

<code>in</code>	<a href="#">SamplingGrid</a> object to be copied
-----------------	--

## 6.8.3.3 setSwitchNumber()

```
void TireGround::SamplingGrid::setSwitchNumber (
    int_type const _Switch ) [inline]
```

Set number of maximum RoadTriangles in the [Tire Shadow](#) (switch to sampling)

Parameters

<code>_Switch</code>	New switch number
----------------------	-------------------

The documentation for this class was generated from the following file:

- include/PatchTire.hh

## 6.9 TireGround::Shadow Class Reference

2D shadow (2D bounding box enhacement)

```
#include <PatchTire.hh>
```

### Public Member Functions

- [Shadow](#) ()

*Get lower side [Tire](#) [G2Lib::AABBtree](#) (3D projection on ground)*

### 6.9.1 Detailed Description

2D shadow (2D bounding box enhacement)

### 6.9.2 Constructor & Destructor Documentation

#### 6.9.2.1 Shadow()

```
TireGround::Shadow::Shadow (
    ETRTO const & TireGeometry,
    ReferenceFrame const & RF ) [inline]
```

Variable set constructor

Warning: Rotation matrix must be orthonormal!

Parameters

<i>TireGeometry</i>	<a href="#">Tire ETRTO</a> denomination
<i>RF</i>	<a href="#">Tire ReferenceFrame</a>

### 6.9.3 Member Function Documentation

### 6.9.3.1 update()

```
void TireGround::Shadow::update (
    ETRTO const & TireGeometry,
    ReferenceFrame const & RF )
```

Update the 2D tire shadow domain

Warning: Rotation matrix must be orthonormal!

Parameters

<i>TireGeometry</i>	<a href="#">Tire ETRTO</a> denomination
<i>RF</i>	<a href="#">Tire ReferenceFrame</a>

### 6.11.1 Detailed Description

Base class for [Tire](#) models.

### 6.11.2 Constructor & Destructor Documentation

#### 6.11.2.1 Tire()

```
TireGround::Tire::Tire (
    real_type const SectionWidth,
    real_type const AspectRatio,
    real_type const RimDiameter,
    int_type const PointsN,
    int_type const DisksN ) [inline]
```

Variable set constructor.

Parameters

<i>SectionWidth</i>	<a href="#">Tire</a> section width [ <i>m</i> ]
<i>AspectRatio</i>	<a href="#">Tire</a> aspect ratio [ % ]
<i>RimDiameter</i>	Rim diameter [ <i>in</i> ]
<i>PointsN</i>	Sampling points for each <a href="#">Disk</a> (divisions on <i>X</i> -axis)
<i>DisksN</i>	Number of Disks (divisions on <i>Y</i> -axis −1)

### 6.11.3 Member Function Documentation

#### 6.11.3.1 evaluateContact()

```
virtual void TireGround::Tire::evaluateContact (
    RDF::TriangleRoad_list const & TriList ) [pure virtual]
```

Evaluate contact with RoadTriangles.

Parameters

<i>TriList</i>	Shadow/MeshSurface intersected triangles
----------------	--

Implemented in [TireGround::MagicFormula](#).

6.11.3.2 `getArea()` [1/2]

```
virtual void TireGround::Tire::getArea (
    real_type & _Area ) const [pure virtual]
```

Get approximated contact area on [Disk](#) plane [  $m^2$  ].

Parameters

<code>_Area</code>	Contact area [ $m^2$ ]
--------------------	------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

6.11.3.3 `getArea()` [2/2]

```
virtual void TireGround::Tire::getArea (
    row_vecN & Area ) const [pure virtual]
```

Get approximated contact areas vector on [Disk](#) plane [  $m^2$  ].

Parameters

<code>Area</code>	Contact areas vector [ $m^2$ ]
-------------------	--------------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

6.11.3.4 `getEulerAngleX()`

```
real_type TireGround::Tire::getEulerAngleX (
    void ) const [inline]
```

Get current Euler angles [  $rad$  ] for  $X$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

6.11.3.5 `getEulerAngleY()`

```
real_type TireGround::Tire::getEulerAngleY (
    void ) const [inline]
```

Get current Euler angles [  $rad$  ] for  $Y$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

6.11.3.6 `getEulerAngleZ()`

```
real_type TireGround::Tire::getEulerAngleZ (
    void ) const [inline]
```

Get current Euler angles [  $rad$  ] for  $Z$ -axis

Warning: Factor as  $[R_z][R_x][R_y]!$

6.11.3.7 `getFriction()` [1/2]

```
virtual void TireGround::Tire::getFriction (
    real_type & Friction ) const [pure virtual]
```

Get contact point friction.

Parameters

<i>Friction</i>	Contact point friction
-----------------	------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

#### 6.11.3.8 getFriction() [2/2]

```
virtual void TireGround::Tire::getFriction (
    row_vecN & Friction ) const [pure virtual]
```

Get contact frictions vector.

Parameters

<i>Friction</i>	Contact frictions vector
-----------------	--------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

#### 6.11.3.9 getMFpoint() [1/2]

```
virtual void TireGround::Tire::getMFpoint (
    vec3 & Point ) const [pure virtual]
```

Get Magic Formula contact point.

Parameters

<i>Point</i>	Magic Formula contact point
--------------	-----------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

#### 6.11.3.10 getMFpoint() [2/2]

```
virtual void TireGround::Tire::getMFpoint (
    row_vec3 & Point ) const [pure virtual]
```

Get Magic Formula contact point vector.

Parameters

<i>Point</i>	Magic Formula Contact point vector
--------------	------------------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

#### 6.11.3.11 getMFpointRF() [1/2]

```
virtual void TireGround::Tire::getMFpointRF (
    mat4 & PointRF ) const [pure virtual]
```

Get Magic Formula contact point reference frame with 4x4 transformation matrix.

## Parameters

<i>PointRF</i>	Magic Formula contact point reference frame
----------------	---

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

## 6.11.3.12 getMFpointRF() [2/2]

```
virtual void TireGround::Tire::getMFpointRF (
    row_mat4 & PointRF ) const [pure virtual]
```

Get Magic Formula contact point reference frame vector with 4x4 transformation matrix.

## Parameters

<i>PointRF</i>	Magic Formula ontact point reference frames vector
----------------	--

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

## 6.11.3.13 getNormal() [1/2]

```
virtual void TireGround::Tire::getNormal (
    vec3 & Normal ) const [pure virtual]
```

Get contact normal versor.

## Parameters

<i>Normal</i>	Contact point normal direction
---------------	--------------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

## 6.11.3.14 getNormal() [2/2]

```
virtual void TireGround::Tire::getNormal (
    row_vec3 & Normal ) const [pure virtual]
```

Get contact normal versors vector.

## Parameters

<i>Normal</i>	Contact point normal direction vector
---------------	---------------------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

## 6.11.3.15 getRelativeCamber()

```
void TireGround::Tire::getRelativeCamber (
    real_type & RelativeCamber ) const
```

Get relative camber angle [ *rad*].

## Parameters

<i>RelativeCamber</i>	Relative camber angle
-----------------------	-----------------------

## 6.11.3.16 getRho() [1/2]

```
virtual void TireGround::Tire::getRho (
    real_type & Rho ) const [pure virtual]
```

Get contact depth at center point [ *m*]

Warning: (if negative the tire does not touch the ground)!

## Parameters

<i>Rho</i>	Depth at center point
------------	-----------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

## 6.11.3.17 getRho() [2/2]

```
virtual void TireGround::Tire::getRho (
    row_vecN & Rho ) const [pure virtual]
```

Get contact depth vector [ *m*]

Warning: (if negative the tire does not touch the ground)!

## Parameters

<i>Rho</i>	Depth vector [ <i>m</i> ]
------------	---------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

## 6.11.3.18 getRhoDot() [1/2]

```
virtual void TireGround::Tire::getRhoDot (
    real_type const & Rho,
    real_type const & Time,
    real_type & RhoDot ) const [pure virtual]
```

Get contact depth time derivative [ *m/s*].

## Parameters

<i>Rho</i>	Previous time step Rho [ <i>m</i> ]
<i>Time</i>	Time step [ <i>s</i> ]
<i>RhoDot</i>	Penetration derivative [ <i>m/s</i> ]

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

6.11.3.19 `getRhoDot()` [2/2]

```
virtual void TireGround::Tire::getRhoDot (
    row_vecN const & Rho,
    real_type const & Time,
    row_vecN & RhoDot ) const [pure virtual]
```

Get contact depth time derivative vector [  $m/s$  ].

Parameters

<i>Rho</i>	Previous time step Rho [ $m$ ]
<i>Time</i>	Time step [ $s$ ]
<i>RhoDot</i>	Penetration derivative [ $m/s$ ]

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

6.11.3.20 `getVolume()` [1/2]

```
virtual void TireGround::Tire::getVolume (
    real_type & Volume ) const [pure virtual]
```

Get approximated contact volume [  $m^3$  ].

Parameters

<i>Volume</i>	Contact volume [ $m^3$ ]
---------------	--------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

6.11.3.21 `getVolume()` [2/2]

```
virtual void TireGround::Tire::getVolume (
    row_vecN & _Volume ) const [pure virtual]
```

Get approximated contact volume [  $m^3$  ].

Parameters

<i>_Volume</i>	Contact volume vector [ $m^3$ ]
----------------	---------------------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

6.11.3.22 `pointSampling()`

```
bool TireGround::Tire::pointSampling (
    RDF::TriangleRoad_list const & TriList,
    vec3 const & RayOrigin,
    vec3 const & RayDirection,
    vec3 & SampledPt,
    real_type & TriFriction = quietNaN,
    vec3 & TriNormal = vec3_NaN ) const [protected]
```

Perform one point sampling (ray-triangle intersection)

Parameters

<i>TriList</i>	Shadow/MeshSurface intersected triangles
<i>RayOrigin</i>	Ray origin
<i>RayDirection</i>	Ray direction
<i>SampledPt</i>	Intersection point
<i>TriFriction</i>	Intersected triangle friction
<i>TriNormal</i>	Intersected triangle normal

### 6.11.3.23 print()

```
virtual void TireGround::Tire::print (
    ostream_type & stream ) const [pure virtual]
```

Print contact parameters.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

### 6.11.3.24 printETRTOGeometry()

```
void TireGround::Tire::printETRTOGeometry (
    ostream_type & stream ) const [inline]
```

Display [Tire ETRTO](#) geometry data.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

### 6.11.3.25 setOrigin()

```
void TireGround::Tire::setOrigin (
    vec3 const & Origin ) [inline]
```

Set a new tire origin.

Parameters

<i>Origin</i>	<a href="#">Tire</a> origin
---------------	-----------------------------

## 6.11.3.26 setReferenceFrame()

```
void TireGround::Tire::setReferenceFrame (
    ReferenceFrame const & _RF ) [inline]
```

Copy the tire [ReferenceFrame](#) object

Warning: Rotation matrix must be orthonormal!

Parameters

<i>_RF</i>	<a href="#">ReferenceFrame</a> object to be copied
------------	--

## 6.11.3.27 setRotationMatrix()

```
void TireGround::Tire::setRotationMatrix (
    mat3 const & RotationMatrix ) [inline]
```

Set a new 3x3 rotation matrix

Warning: Rotation matrix must be orthonormal!

Parameters

<i>RotationMatrix</i>	Rotation matrix
-----------------------	-----------------

## 6.11.3.28 setTotalTransformationMatrix()

```
void TireGround::Tire::setTotalTransformationMatrix (
    mat4 const & TM ) [inline]
```

Set 4x4 total transformation matrix

Warning: Rotation matrix must be orthonormal!

Parameters

<i>TM</i>	4x4 total transformation matrix
-----------	---------------------------------

## 6.11.3.29 setup()

```
virtual bool TireGround::Tire::setup (
    RDF::MeshSurface & Mesh,
    mat4 const & TM ) [pure virtual]
```

Update current tire position and find contact parameters.

Parameters

<i>Mesh</i>	MeshSurface object (road)
<i>TM</i>	4x4 total transformation matrix

Implemented in [TireGround::MultiDisk](#), and [TireGround::MagicFormula](#).

The documentation for this class was generated from the following file:

### 6.12.1 Detailed Description

3D triangle (pure geometrical description)

### 6.12.2 Constructor & Destructor Documentation

#### 6.12.2.1 `Triangle3D()`

```
TireGround::RDF::Triangle3D::Triangle3D (
    vec3 const _Vertices[3] ) [inline]
```

Variable set constructor.

Parameters

<code>_Vertices</code>	Vertices reference vector
------------------------	---------------------------

### 6.12.3 Member Function Documentation

## 6.12.3.1 intersectEdgePlane()

```
int_type TireGround::RDF::Triangle3D::intersectEdgePlane (
    vec3 const & PlaneN,
    vec3 const & PlaneP,
    int_type const Edge,
    vec3 & IntPt1,
    vec3 & IntPt2 ) const
```

Check if an edge of the [Triangle3D](#) object hits a and find the intersection point

Parameters

<i>PlaneN</i>	Plane normal vector
<i>PlaneP</i>	Plane known point
<i>Edge</i>	Triangle edge number (0:2)
<i>IntPt1</i>	Intersection point 1
<i>IntPt2</i>	Intersection point 2

## 6.12.3.2 intersectPlane()

```
bool TireGround::RDF::Triangle3D::intersectPlane (
    vec3 const & PlaneN,
    vec3 const & PlaneP,
    std::vector< vec3 > & IntPts ) const
```

Check if a plane intersects a [Triangle3D](#) object and find the intersection points

Parameters

<i>PlaneN</i>	Plane normal vector
<i>PlaneP</i>	Plane known point
<i>IntPts</i>	Intersection points

## 6.12.3.3 intersectRay()

```
bool TireGround::RDF::Triangle3D::intersectRay (
    vec3 const & RayOrigin,
    vec3 const & RayDirection,
    vec3 & IntPt ) const
```

Check if a ray hits a [Triangle3D](#) object through Möller-Trumbore intersection algorithm

Parameters

<i>RayOrigin</i>	Ray origin position
<i>RayDirection</i>	Ray direction vector
<i>IntPt</i>	Intersection point

#### 6.12.3.4 print()

```
void TireGround::RDF::Triangle3D::print (
    ostream_type & stream ) const [inline]
```

Print vertices data.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

#### 6.12.3.5 setVertices() [1/2]

```
void TireGround::RDF::Triangle3D::setVertices (
    vec3 const _Vertices[3] ) [inline]
```

Set new vertices and update bounding box domain.

Parameters

<i>_Vertices</i>	Vertices reference vector
------------------	---------------------------

#### 6.12.3.6 setVertices() [2/2]

```
void TireGround::RDF::Triangle3D::setVertices (
    vec3 const & Vertex0,
    vec3 const & Vertex1,
    vec3 const & Vertex2 ) [inline]
```

Set new vertices then update bounding box domain and normal versor.

Parameters

<i>Vertex0</i>	Vertex 1
<i>Vertex1</i>	Vertex 2
<i>Vertex2</i>	Vertex 3

### 6.13.1 Detailed Description

3D triangles for road representation

### 6.13.2 Constructor & Destructor Documentation

#### 6.13.2.1 TriangleRoad()

```
TireGround::RDF::TriangleRoad::TriangleRoad (
    vec3 const _Vertices[3],
    real_type _Friction ) [inline]
```

Variable set constructor.

Parameters

<code>_Vertices</code>	Vertices reference vector
<code>_Friction</code>	Friction coefficient

### 6.13.3 Member Function Documentation

#### 6.13.3.1 intersectEdgePlane()

```
int_type TireGround::RDF::Triangle3D::intersectEdgePlane (
    vec3 const & PlaneN,
    vec3 const & PlaneP,
```

```

    int_type const Edge,
    vec3 & IntPt1,
    vec3 & IntPt2 ) const [inherited]

```

Check if an edge of the [Triangle3D](#) object hits a and find the intersection point

Parameters

<i>PlaneN</i>	Plane normal vector
<i>PlaneP</i>	Plane known point
<i>Edge</i>	Triangle edge number (0:2)
<i>IntPt1</i>	Intersection point 1
<i>IntPt2</i>	Intersection point 2

#### 6.13.3.2 intersectPlane()

```

bool TireGround::RDF::Triangle3D::intersectPlane (
    vec3 const & PlaneN,
    vec3 const & PlaneP,
    std::vector< vec3 > & IntPts ) const [inherited]

```

Check if a plane intersects a [Triangle3D](#) object and find the intersection points

Parameters

<i>PlaneN</i>	Plane normal vector
<i>PlaneP</i>	Plane known point
<i>IntPts</i>	Intersection points

#### 6.13.3.3 intersectRay()

```

bool TireGround::RDF::Triangle3D::intersectRay (
    vec3 const & RayOrigin,
    vec3 const & RayDirection,
    vec3 & IntPt ) const [inherited]

```

Check if a ray hits a [Triangle3D](#) object through Möller-Trumbore intersection algorithm

Parameters

<i>RayOrigin</i>	Ray origin position
<i>RayDirection</i>	Ray direction vector
<i>IntPt</i>	Intersection point

#### 6.13.3.4 print()

```

void TireGround::RDF::Triangle3D::print (
    ostream_type & stream ) const [inline], [inherited]

```

Print vertices data.

Parameters

<i>stream</i>	Output stream type
---------------	--------------------

#### 6.13.3.5 setFriction()

```
void TireGround::RDF::TriangleRoad::setFriction (
    real_type _Friction ) [inline]
```

Set friction coefficient.

Parameters

<i>_Friction</i>	New friction coefficient
------------------	--------------------------

#### 6.13.3.6 setVertices() [1/2]

```
void TireGround::RDF::Triangle3D::setVertices (
    vec3 const _Vertices[3] ) [inline], [inherited]
```

Set new vertices and update bounding box domain.

Parameters

<i>_Vertices</i>	Vertices reference vector
------------------	---------------------------

#### 6.13.3.7 setVertices() [2/2]

```
void TireGround::RDF::Triangle3D::setVertices (
    vec3 const & Vertex0,
    vec3 const & Vertex1,
    vec3 const & Vertex2 ) [inline], [inherited]
```

Set new vertices then update bounding box domain and normal versor.

Parameters

<i>Vertex0</i>	Vertex 1
<i>Vertex1</i>	Vertex 2
<i>Vertex2</i>	Vertex 3

The documentation for this class was generated from the following file:
